1.0 Introduction to Web Tools

This document contains a Reference Guide to the Service Delivery Calculator Service Commitment APIs. See the Developer’s Guide to learn the administrative process for gaining access to the Web Tools APIs as well as the basic mechanism for calling the APIs and processing the results. The Developer’s Guide also contains information on testing and trouble-shooting.

Note: The Request Parameter sections present the XML input tags for generating live requests along with the restrictions on the values allowed. An error message will be returned if an incorrect value is entered. Also, be aware of the maximum character amounts allowed for some tags. If the user enters more than those amounts, an error will not be generated. The Web Tool will simply pass in the characters up to the maximum amount allowed and disregard the rest. This is important since the resulting value could prevent a correct response.

When building the XML request, pay particular attention to the order and case for tags. An error message will be returned if an incorrect value is entered. Remember that all data and attribute values in this document are for illustration purposes and are to be replaced by your actual values. For instance, a line of sample code may be:

```xml
<DestinationZIP> 12345 </DestinationZIP>
```

In this instance, you will replace “12345” with the destination zip code for your request.

For information on registering and getting started with Web Tools, please refer to the Step-By-Step guide found on the Technical Documentation section of the Web Tools page on usps.com/webtools.

2.0 SDCGetLocations API

2.1 Overview

The SDCGetLocations Web Tool lets customers get estimates on delivery standards between 3 or 5 digit zip codes for Priority Mail Express, Priority Mail, First Class Mail, Marketing Mail, Periodicals, and Package Services.

The data returned by the SDCGetLocations Web Tool is intended for display only. The content or sequence of the string data returned by the Web Tool may change.

### 2.7 Error Responses

Error conditions are handled at the main XML document level. When parsing, it is best to check for an error document first before checking for good data. Error documents have the following format:

```xml
<Error>
  <Number></Number>
  <Source></Source>
  <Description></Description>
  <HelpFile></HelpFile>
  <HelpContext></HelpContext>
</Error>
```

Where:

- **Number** = the error number generated by the Web Tools server.
- **Source** = the component and interface that generated the error on the Web Tools server.
- **Description** = the error description.
- **HelpFile** = [reserved for future use].
- **HelpContext** = [reserved for future use].
Below is an example for an error that occurred because the destination zip code contained more than 5 positions:

```
<Error>
   <Number>-2147219300</Number>
   <Source>clsSDCGetLocations:Respond</Source>
   <Description>Invalid Destination ZIP Code.</Description>
   <HelpFile></HelpFile>
   <HelpContext></HelpContext>
</Error>
```
